# Meet The Presenter

## Marc Fishman, M.D.

Marc Fishman, MD, is an addiction psychiatrist, Medical Director of Maryland Treatment Centers, and a member of the Psychiatry faculty of the Johns Hopkins University School of Medicine. Dr Fishman leads Maryland Treatment Centers, a regional behavioral health care provider, which includes Mountain Manor Treatment Centers in Baltimore and Emmitsburg as well as several other inpatient and outpatient programs. In that role he has been involved in development and implementation of innovative programming in addiction and co-occurring disorder treatment. His clinical specialties include treatment of drug-involved and dual-diagnosis youth, opioid addiction in adolescents and adults, and addiction with co-occurring psychiatric disorders. His research work has focused on medication treatment for SUDs as well as, models of care and treatment outcomes in youth, in particular opioid addiction. He has been a president of the MD Society of Addiction Medicine and is currently a member of its Board.

 **BHIPP**  
Maryland Behavioral  
Health Integration in  
Pediatric Primary Care

# Who We Are – Maryland BHIPP

## Offering support to pediatric primary care providers through free:

- Telephone consultation (855-MD-BHIPP)
- Resource & referral support
- Training & education
- Regionally specific social work co-location (Salisbury University and Morgan State University)
- Project ECHO®

## *Coming soon!*

- Direct Telespsychiatry & Telecounseling Services
- Care coordination

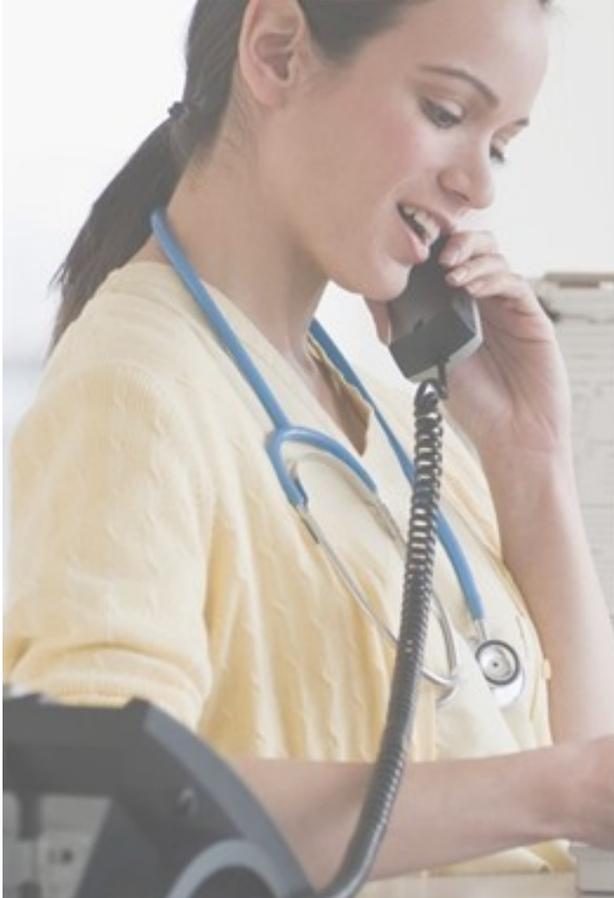

# Partners & Funding

- BHIPP is supported by funding from the **Maryland Department of Health, Behavioral Health Administration** and operates as a collaboration between the **University of Maryland School of Medicine**, the **Johns Hopkins University School of Medicine**, **Salisbury University** and **Morgan State University**.
- *This program is supported by the **Health Resources and Services Administration (HRSA)** of the U.S. Department of Health and Human Services (HHS) as part of an award totaling \$433,296 with approximately 20% financed by non-governmental sources. The contents of this presentation are those of the author(s) and do not necessarily represent the official views of, nor an endorsement, by HRSA, HHS or the U.S. Government. For more information, visit [www.hrsa.gov](http://www.hrsa.gov).*

# BHIPP is Available to Provide Support to PCPs During the Pandemic

**BHIPP is open.**

*The BHIPP phone line remains open during this challenging time to support primary care clinicians in assessing and managing the mental health needs of their patients.*

**1-855-MD-BHIPP**  
(1-855-632-4477)

# Maryland Addiction Consultation Service (MACS)

*Provides support to prescribers and their practices in addressing the needs of their patients with substance use disorders and chronic pain management.*

## **All Services are FREE**

- Phone consultation for clinical questions
- Education and training opportunities related to substance use disorders and chronic pain management
- Assistance with addiction and behavioral health resources and referrals
- Technical assistance to practices implementing or expanding office-based addiction treatment services
- MACS TeleECHO™ Clinics: collaborative medical education through didactic presentations and case-based learning

# Outline

- Background and scope of the problem
- Psychiatric use for co-occurring disorders: impact and problems
- Treatment of use disorder
- Case illustrations
- Conclusions

# Benzodiazepines

**MACS**  
Maryland Addiction Consultation Service

# BZD use trends

- BZD use very common: 12-15% of US adults, and
  - Increasing: up 67% 1996→2013
- Of these ~20% have misused
  - Young adults 50%
- 15-30% of opioid OD deaths involve BZDs
- 85-95% of BZD deaths involve opioids

Blanco et al. al. Prevalence and Correlates of Benzodiazepine Use, Misuse, and Use Disorders Among Adults in the United States. J Clin Psych2018

Bachhuber et al. Increasing Benzodiazepine Prescriptions and Overdose Mortality in the United States, 1996-2013. Am J Public Health. 2016;106(4):686-688.

Health Integration in  
Pediatric Primary Care

# Impact of the pandemic

Along with US ODs and OD deaths broadly  
2019 → 2020:

- ED visits for BZD OD increased 24%
- OD deaths increased
  - Prescription -- 22%
  - Non-prescription -- 520%

Liu S, et al. Trends in Nonfatal and Fatal Overdoses Involving Benzodiazepines — 38 States and the District of Columbia, 2019–2020. MMWR Morb Mortal Wkly Rep 2021;70:1136–1141. DOI: <http://dx.doi.org/10.15585/mmwr.mm7034a2external> [icon](#).

# BZDs use profile

- Alprazolam (short-acting) most commonly misused
- Clonazepam, diazepam, zolpidem, others
- Often used in poly-substance combination
- Common problem of mixed non-medical and medical including doctor shopping

# Characteristics of BZDs

- Very reinforcing
- Tolerance – dose escalation is typical
- Short-lived relief
- Prominent side effect profile
  - Intoxication, sometimes subtle (“alcohol in a pill”)
  - Disinhibition
  - Affective instability
  - Rebound anxiety
  - Cognitive impairment
  - Physiologic dependence and withdrawal

# Anxiety

- A symptom not a disease
- “I’ve tried everything and nothing works except xanax”
  - Characteristic side effect profile of benzos including worsening anxiety, cognitive impairment, subtle intoxication
  - Immediate relief vs lasting relief
- SSRI + CBT usually most effective, but takes time (“I don’t have depression”)
- Desensitization, self-soothing, tools for stress relief

# Withdrawal management

- Switch to longer-acting agent (eg clonazepam, diazepam)
- Taper: 1-2 wks up to months
- Chronic users have considerable difficulty getting off
- Morbidity similar to alcohol withdrawal – potential for seizures, hallucinosis, delirium
- Ancillary meds
  - Insomnia – trazodone, quetiapine, mirtazapine
  - Sympatholytic – clonidine
  - Gaba-ergic substitute – gabapentin
- Consider bed-based care
- Consider longer taper, but complicated by inability to distinguish prescribed from non-prescribed on UDS

# Longer-term treatment

- Very low threshold for diagnosis and treatment of affective disorder
- Even if hypothesis is substance-induced etiology, tends not to resolve quickly for many, maybe shorter term treatment
- Gabapentin as maintenance gaba-ergic substitute, not evidence based but reasonable

# Anxiety

- “I’ve tried everything and nothing works except xanax”
- Anxiety as a symptom not a disease, conceptualize as a feature of affective disorder
- “you don’t understand... I don’t have depression”
- “You’re targeting me as a drug addict but I’ve never abused it...”
- It’s not that I think you’ll abuse it, it’s that I think it will make you worse
- Immediate but unsustainable relief vs slow but lasting relief
- SSRI + CBT usually most effective, but takes time
- Desensitization, self-soothing, repertoire of tools for stress relief

# Case

- 20 F
- Onset cannabis/ alcohol 15
- Chronic depression /anxiety /panic, intermittent Rx antidepressants +/- alprazolam, erratic adherence
- Presents for eval: “nothing works except Xanax”
- Alternative scenarios:
  - presents to primary care
  - presents to psychiatric care
  - presents to SUD care
  - onset opioids age 18
  - Rx alprazolam with another provider

## Conclusions - BZDs

- BZDs common, increasing both medical and non-medical
- Dangerous OD risk in combination with alcohol and esp opioids
- Side effect profile overall not favorable, esp for youth
- Contraindicated with concurrent SUD and SUD risk
- Treatment for use disorder difficult but worth undertaking, requires integrated approach

# Prescription stimulants

**MACS**  
Maryland Addiction Consultation Service

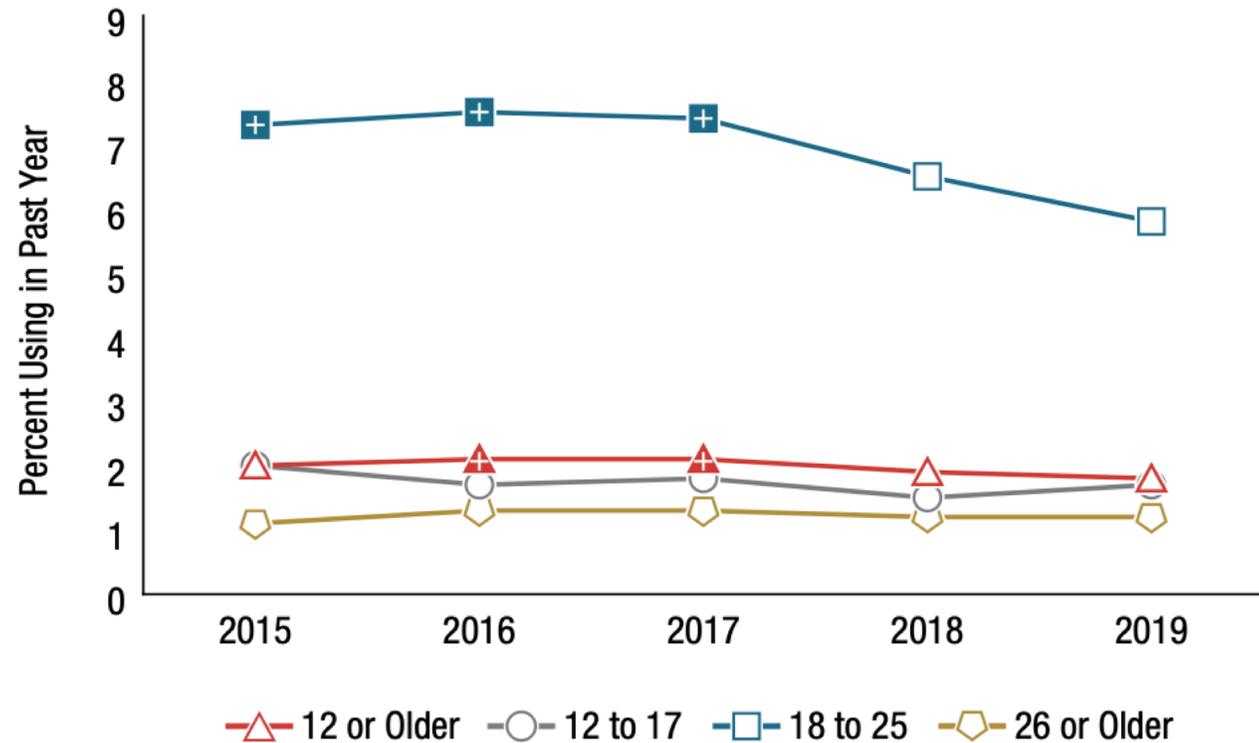

# Prescription stimulant use trends

- Rx stimulant use common: 6% of US adults
- Of these ~1/3 have misused, half of those getting supply from others
- Use among college students 10-20%, 40-80% non-medical
- 20% of youth prescribed Rx stimulant divert

Compton et al et al. Disorders, and Motivations for Misuse Among Adults in the United States. *Am J Psych.* 2018

# Trends in Rx stimulant use

**Figure 18. Past Year Prescription Stimulant Misuse among People Aged 12 or Older: 2015-2019**

+ Difference between this estimate and the 2019 estimate is statistically significant at the .05 level.

# Prescription stimulants

- Medical uses: ADHD, narcolepsy
- Mechanism: increase brain dopamine levels
- Sustained release vs immediate release
- Examples: methylphenidate (Ritalin), mixed amphetamine salts (Adderall), lisdexamfetamine (Vyvanse), etc

# Prescription stimulants

## Main effects

- Increased alertness, delayed sleep
- Increased concentration, attention, focus
- Increased energy, confidence, enhanced mood
- Appetite suppression

# Prescription stimulants

## Side effects

### Common

- Nervousness, anxiety
- Depression, lability, mood destabilization
- Insomnia
- Appetite suppression
- Increased heart rate and blood pressure
- Tolerance, dose escalation, craving

### Less common

- Addiction
- Cardiac rhythm problems
- Psychosis

# Prescription stimulants

- Stimulants improve attention but often problematic
  - Exacerbation of prominent affective instability
  - Very reinforcing
- Diversion
- Misuse

# Smart drugs?

## Characteristics of college students who misuse Rx stimulants

Behavior	Odds ratio
Substance Use, past 30d	
Marijuana	11
Ecstasy	16
Cocaine	20
Opiates	11
Cigarettes	6
Frequent binge drinking	7
Passenger with a drunk driver	7
Drove after drinking	4
Drove after binge drinking	5

N= 10,904  
McCabe et al. Addiction. 2003.

# Characteristics of college students who misuse Rx stimulants

	Past year non-medical users prescription stimulants	Non-users
Classes skipped (%)	16	9
Time studying (hrs/wk)	17	20
Time “going out” (hrs/wk)	30	25

N= 1,253.  
Arria et al. J Drug Issues. 2008.

# Which are the better performance enhancers?

- Sleep
- Going to class
- Asking for help
- Time management
- Doing the work
- Being thoughtful and creative
- Starbucks
- More Starbucks
- Prescription stimulants

# Rx for ADHD with co-morbid SUD

- Treat ADHD, continue stimulants if doing well, but consider other non-stimulant Rx
  - Bupropion, SNRI's, TCA's
  - I know you can't "feel it," that's perfect
- If stimulants,
  - Use long acting preparations (OROS methylphenidate also not crushable)
  - Watch for dose escalation
  - Close monitoring including UDS
  - Concurrent SUD treatment
  - Abstinence contingency

# Treatment of use disorder

- Taper using long acting agent
- Usually can accomplish in 1-2 wks
- Longer tapers sometimes helpful
- Rebound inattention, depression, fatigue
- Bupropion may be helpful

# Case

- 17 M
- Onset cannabis/ alcohol 14
- Chronic inattention / distractability, intermittent Rx stimulants, mixed reponse
- Presents for eval seeking adderall
- Alternative scenarios:
  - presents to primary care
  - presents to psychiatric care
  - presents to SUD care
  - Hx misuse of Rx stimulants
  - Hx of cocaine/ methamphetamine

# Conclusions – prescription stimulants

- Rx stimulants common, increasing both medical and non-medical
- Substantial side effect profile underappreciated
- “Smart drugs?” – not so much
- Use caution with concurrent SUD and SUD risk
- Treatment of concurrent SUD and ADHD may be very helpful, but not trivial

# Overall conclusions

- Appreciate problematic side effect profile of sedative hypnotics and prescription stimulants, esp in youth
- Use extreme caution with concurrent substance use and esp SUD
  - BZDs: contraindicated in SUD
  - Prescription stimulants: close supervision and monitoring
- Monitor closely for substance use (UDS should be routine)
- Establish clear standard of expectation of no substance use
- Aggressive treatment of co-occurring conditions
- Expect (and manage) shenanigans
